P.BHAVANA MANASWINI(2520030154)

ABSTRACT

The Lost and Found Tracker in Campus is designed to provide a quick and organized way for students and staff to report, search, and recover lost items within the campus. The application allows users to report lost items or found items by providing details such as item name, category, description, location, date, and images.

The system provides a search and filtering mechanism to help users easily identify matching lost or found items. Users can also receive notifications when a possible match is identified.

The system maintains information about users, lost items, found items, claims, locations, and item status in a relational database.

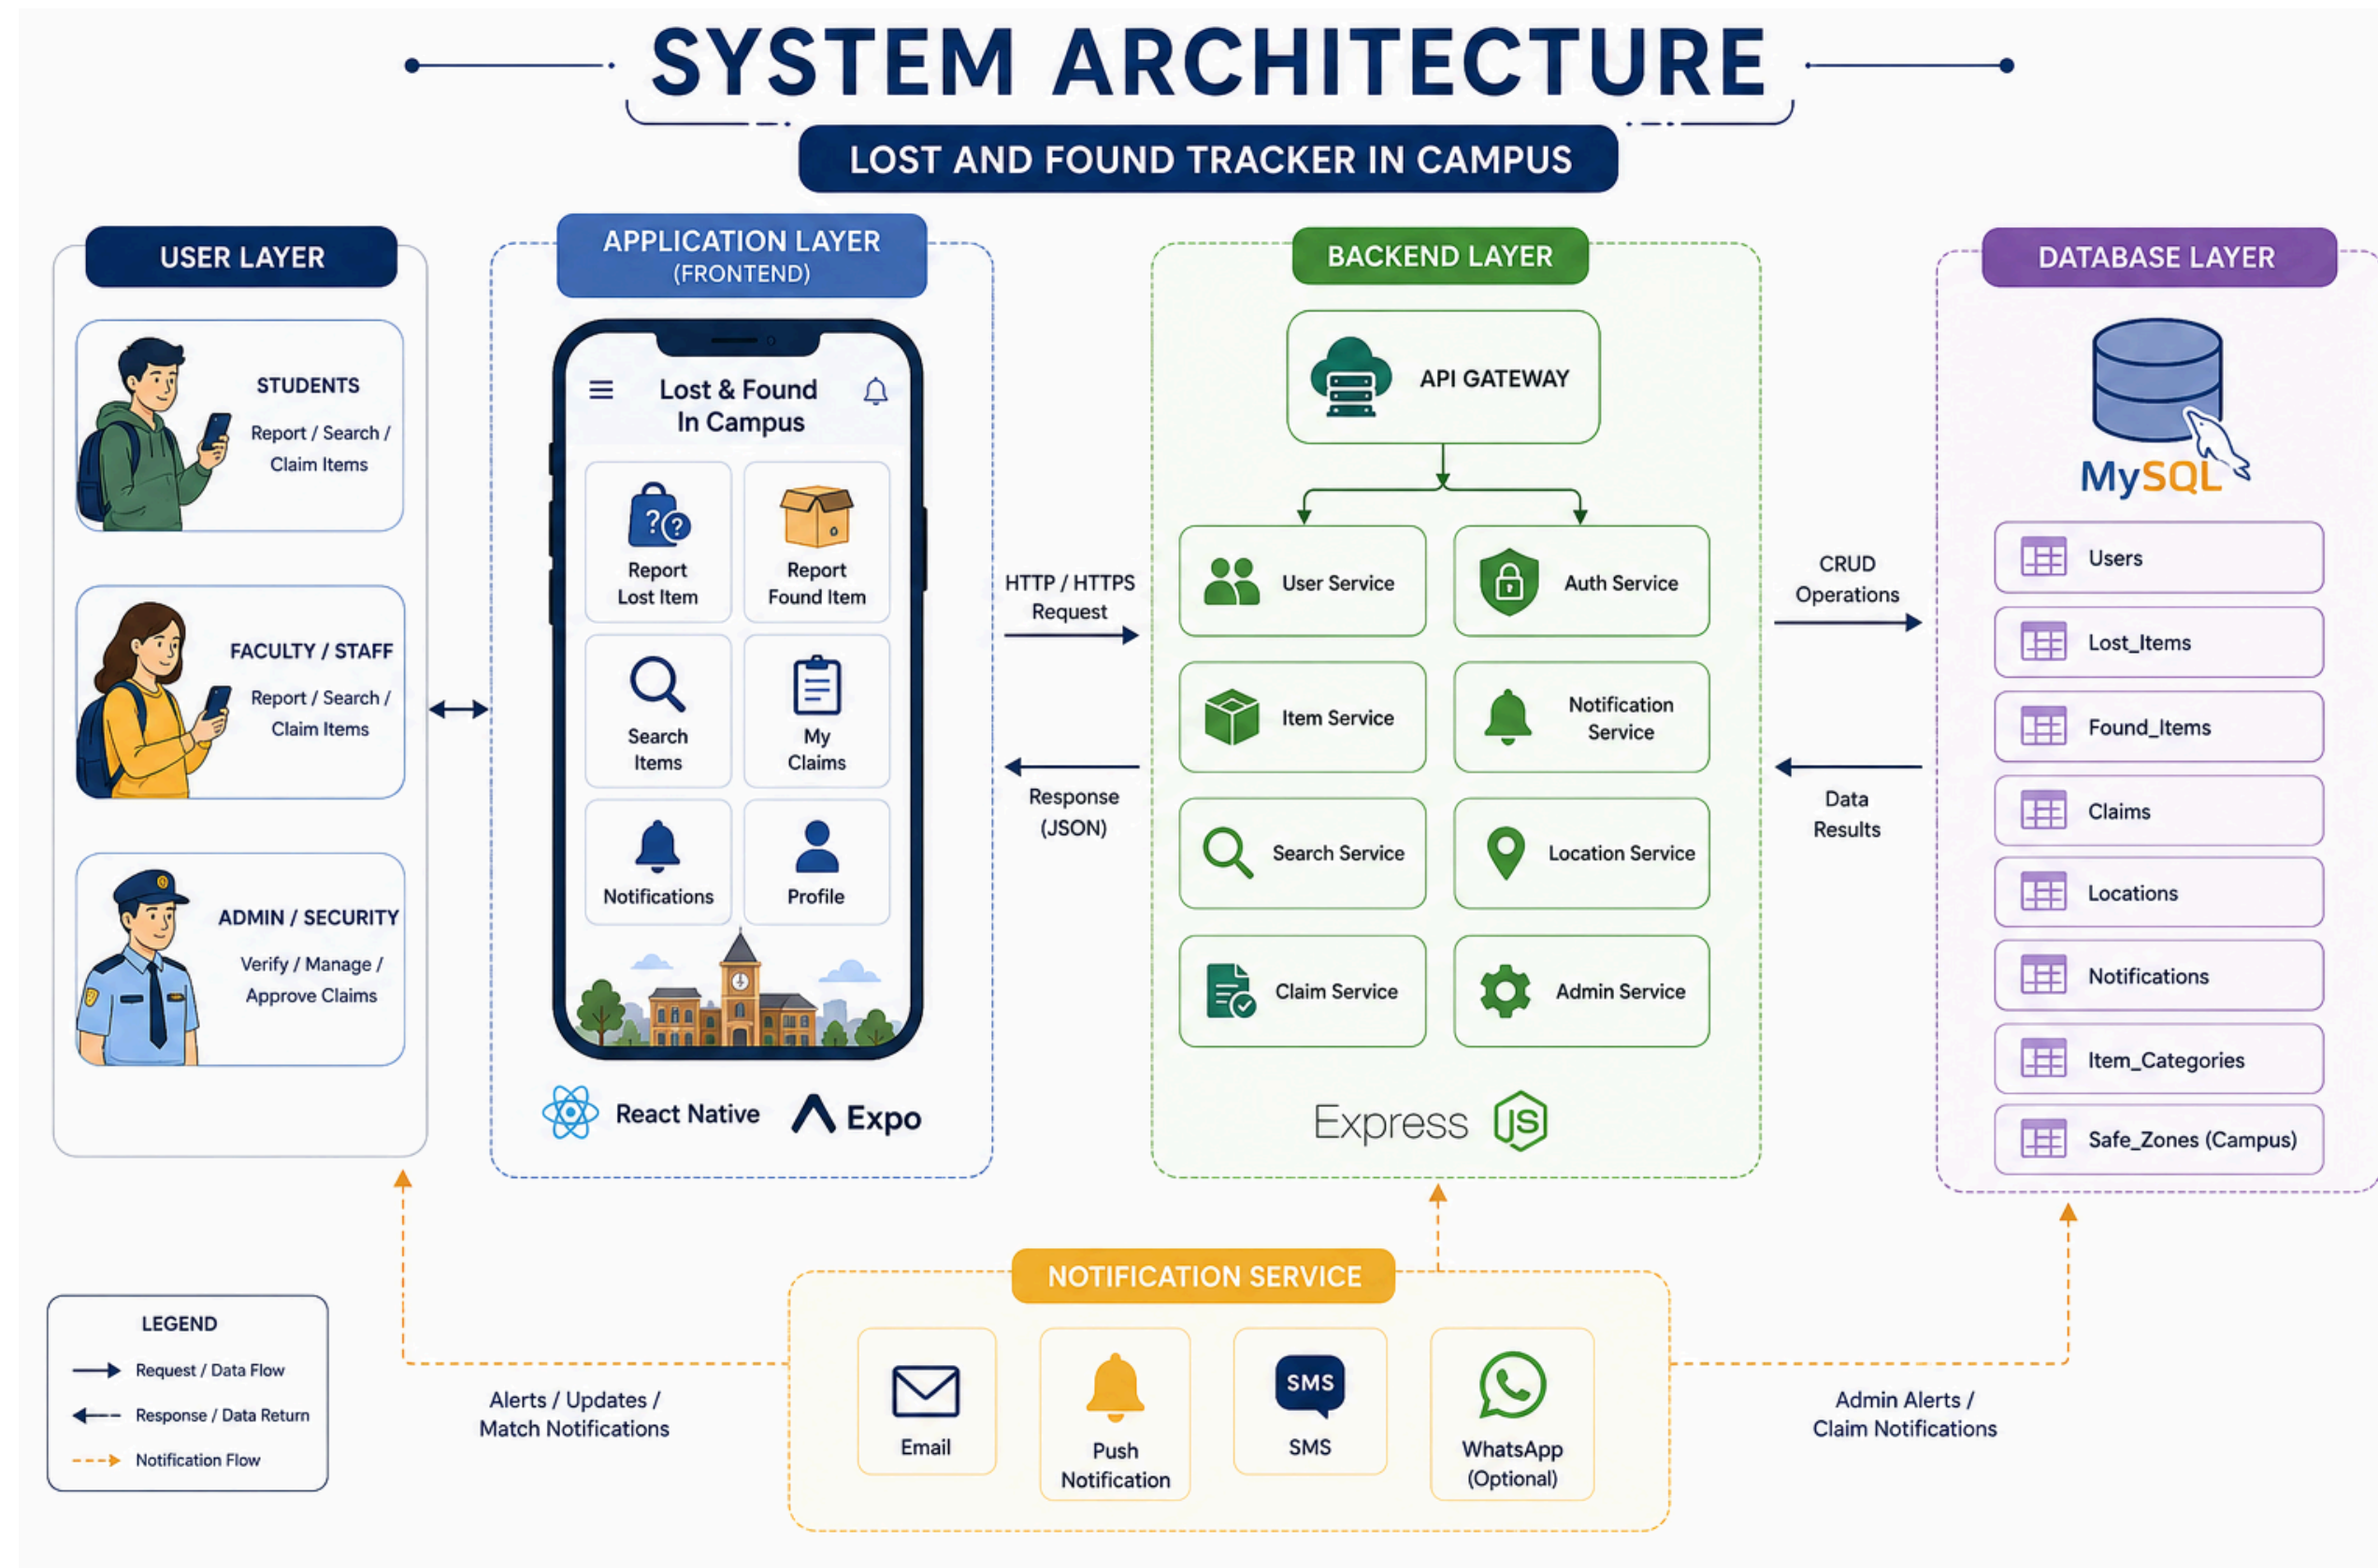

The proposed system reduces the time required to find lost belongings and provides a centralized platform for managing campus lost-and-found activities.

PROBLEM STATEMENT

- Students and staff often lose personal belongings within the campus.
- There is no centralized platform to report lost and found items.
- Manually checking with security offices or classmates can be time-consuming.
- Found items may not reach their actual owners.
- Users may not know where or when an item was found.
- Searching through multiple announcements or groups is difficult.
- There is no systematic mechanism to match lost items with found items.
- Lost-and-found records need to be stored and managed systematically.

Existing System	Proposed System
Lost items are reported manually	Online lost-item reporting
Found items are communicated through groups	Centralized found-item database
Difficult to search for items	Search and filter functionality
No systematic matching	Lost-found item matching
Users may not know item location	Location details are stored
Communication is scattered	Centralized notifications
Records may be lost or incomplete	Lost and found records stored in database
Claim verification is mostly manual	Structured claim and verification process
More time required to recover items	Faster item recovery

PROPOSED SYSTEM ARCHITECTURE

TOOLS USED

APPLICATION & FRONTEND

- React Native
- JavaScript

BACKEND

- Node.js
- Express.js
- VS CODE

DATABASE

MYSQL

LOCATION & MAPS

- Expo Location
- Google Maps

THANK YOU
